

Experiment 1

Data Acquisition and Data Profiling using BI Tools

Aim

To acquire data from multiple sources and perform data profiling using Microsoft Power BI in order to assess data quality, understand data structure, identify anomalies, and prepare data for further analytical processing.

Tools / Software Required

- Microsoft Power BI Desktop
- Sample datasets: Sales_Data.csv, Employee_DB.xlsx, and a sample SQL database

Objective

- To understand the basic concepts of Business Intelligence, data acquisition, and data profiling.
- To acquire data from multiple heterogeneous sources such as CSV, Excel, and SQL Server.
- To import and integrate different datasets into Microsoft Power BI.
- To examine the structure, data types, completeness, uniqueness, and validity of the datasets.
- To examine the structure, data types, completeness, uniqueness, and validity of the datasets.
- To use Power Query Editor's Column Quality, Column Distribution, and Column Profile features for data profiling.
- To document the identified data quality issues and suggest suitable corrective actions before further analysis.

Theory

Business Intelligence (BI)

Business Intelligence refers to a set of technologies, processes, and practices that enable organizations to collect, integrate, analyse, and present business information. BI helps transform raw data into meaningful, actionable insights that support better decision-making across an organization.

Key components of a BI system include:

- Data Sources: Databases (SQL/NoSQL), flat files, cloud stores, and APIs
- ETL Pipeline: Extract, Transform, Load processes that move data from source to destination
- Data Warehouse / Data Lake: Centralized repositories for structured or unstructured data
- BI & Reporting Tool: Microsoft Power BI for data connection, transformation, and visualization
- Analytics Layer: Descriptive, diagnostic, predictive, and prescriptive analytics

Data Acquisition

Data Acquisition is the process of collecting and importing data from various heterogeneous sources into a unified environment for processing. It is the first and foundational step in any BI pipeline. In Power BI, data is acquired through the Get Data option, which supports a wide range of connectors including flat files (CSV, XLSX), relational databases (SQL Server, MySQL), cloud sources (SharePoint, Azure), and web-based sources.

Data Profiling

Data Profiling is the process of examining data from an existing source and collecting statistics, summaries, and metadata about that data. It is a critical quality assurance step that reveals the structure, content, and quality of a dataset before further processing. Data profiling covers the following key dimensions:

- **Completeness:** Percentage of non-null values in each column.
- **Uniqueness:** Ratio of distinct to total values — detects duplicate records.
- **Validity:** Whether values conform to defined rules or expected formats.
- **Consistency:** Uniformity of values across related datasets.
- **Accuracy:** Correctness of values relative to real-world facts.
- **Timeliness:** Currency of data relative to the reporting period.

Data Profiling in Power BI — Power Query Editor

Microsoft Power BI provides built-in data profiling capabilities through the Power Query Editor. Under the View tab, three profiling features can be enabled:

- **Column Quality:** Displays the percentage of valid, error, and empty values per column.
- **Column Distribution:** Shows a histogram of value frequency along with the distinct and unique count for each column.
- **Column Profile:** Provides detailed statistics for a selected column including minimum, maximum, mean, median, standard deviation, and a full value distribution chart.

Conduct

Part A: Data Acquisition

Step 1: Launch Power BI Desktop and import the CSV file.

Home > Get Data > Text/CSV
Browse to Sales_Data.csv > Load

Table: Sales_Data (200 rows)

SaleID	Date	CustomerID	Product	Quantity	UnitPrice	SalesAmount	Region
1	Wednesday, May 21, 2025	C1031	Mouse	1	25	25	South
2	Friday, February 14, 2025	C1075	Monitor	1	500	500	North
3	Tuesday, April 22, 2025	C1029	Printer	1	25	25	North
4	Saturday, November 29, 2025	C1089	Printer	5	50	250	West
5	Wednesday, October 29, 2025	C1035	Laptop	2	250	500	South
6	Friday, May 23, 2025		Mouse	4	100	400	East
7	Monday, July 14, 2025	C1012	Keyboard	1	25	25	East
8	Thursday, January 23, 2025	C1093	Monitor	5	100	500	North
9	Friday, October 10, 2025	C1037	Printer	4	25	100	East
10	Saturday, December 27, 2025	C1008	Laptop	5	50	250	South
11	Wednesday, April 30, 2025	C1012	Monitor	3	25	75	East
12	Tuesday, March 25, 2025	C1047	Keyboard	4	100	400	South
13	Saturday, November 8, 2025	C1081	Mouse	3	25	75	South
14	Monday, July 14, 2025	C1034	Printer	2	250	500	South
15	Monday, April 28, 2025	C1004	Keyboard	3	25	75	West
16	Saturday, April 19, 2025	C1072	Keyboard	3	25	75	South
17	Wednesday, November 26, 2025	C1058	Mouse	4	250	1000	East
18	Wednesday, October 15, 2025	C1068	Keyboard	2	50	100	West
19	Saturday, July 5, 2025	C1028	Mouse	5	250	1250	West
20	Wednesday, February 26, 2025	C1019	Mouse	1	25	25	West
21	Thursday, July 17, 2025	C1048	Printer	5	25	125	West

Step 2: Import the Excel file.

Table: Sales_Data (200 rows)

SaleID	Date	CustomerID	Product	Quantity	UnitPrice	SalesAmount	Region
1	Wednesday, May 21, 2025	C1031	Mouse	1	25	25	South
2	Friday, February 14, 2025	C1075	Monitor	1	500	500	North
3	Tuesday, April 22, 2025	C1029	Printer	1	25	25	North
4	Saturday, November 29, 2025	C1089	Printer	5	50	250	West
5	Wednesday, October 29, 2025	C1035	Laptop	2	250	500	South
6	Friday, May 23, 2025		Mouse	4	100	400	East
7	Monday, July 14, 2025	C1012	Keyboard	1	25	25	East
8	Thursday, January 23, 2025	C1093	Monitor	5	100	500	North
9	Friday, October 10, 2025	C1037	Printer	4	25	100	East
10	Saturday, December 27, 2025	C1008	Laptop	5	50	250	South
11	Wednesday, April 30, 2025	C1012	Monitor	3	25	75	East
12	Tuesday, March 25, 2025	C1047	Keyboard	4	100	400	South
13	Saturday, November 8, 2025	C1081	Mouse	3	25	75	South
14	Monday, July 14, 2025	C1034	Printer	2	250	500	South
15	Monday, April 28, 2025	C1004	Keyboard	3	25	75	West
16	Saturday, April 19, 2025	C1072	Keyboard	3	25	75	South
17	Wednesday, November 26, 2025	C1058	Mouse	4	250	1000	East
18	Wednesday, October 15, 2025	C1068	Keyboard	2	50	100	West
19	Saturday, July 5, 2025	C1028	Mouse	5	250	1250	West
20	Wednesday, February 26, 2025	C1019	Mouse	1	25	25	West
21	Thursday, July 17, 2025	C1048	Printer	5	25	125	West

Home > Get Data > Excel Workbook
Browse to Employee_DB.xlsx > Select the appropriate sheet > Load

Step 3: Connect to the SQL database and import the Transactions table.

Home > Get Data > SQL Server
Enter server name and database credentials > Select Transactions table > Load

Verify that all three data sources appear in the Data pane on the right-hand side of the Power BI window.

Part B: Data Profiling in Power Query Editor

Step 4: Open Power Query Editor.

Home > Transform Data

Step 5: Enable data profiling features.

Select each column one at a time and observe the profiling statistics displayed below the data preview grid.

The screenshot shows the Power BI Transform Data ribbon with the 'View' tab selected. The 'Column profile' and 'Column quality' options are checked. The data preview grid displays the first five columns: SaleID, Date, CustomerID, Product, and Quantity. Each column has a bar chart showing the distribution of values. Below the grid, the 'Column statistics' and 'Value distribution' panels are visible. The 'Column statistics' panel shows the following data:

Column	Count	Error	Empty	Distinct	Unique	NaN	Zero	Min	Max	Average
SaleID	200	0	0	200	200	0	0	1	200	100.5

The 'Value distribution' panel shows a bar chart for each column. The 'Query Settings' panel on the right shows the 'Properties' and 'Applied Steps' sections. The 'Properties' section shows the 'Name' as 'Sales_Data'. The 'Applied Steps' section shows the 'Source' and 'Promoted Headers' steps.

The screenshot shows the Power BI Transform Data ribbon with the 'View' tab selected. The 'Column profile' and 'Column quality' options are checked. The data preview grid displays the first five columns: Date, CustomerID, Product, Quantity, and UnitPrice. Each column has a bar chart showing the distribution of values. Below the grid, the 'Column statistics' and 'Value distribution' panels are visible. The 'Column statistics' panel shows the following data:

Column	Count	Error	Empty	Distinct	Unique	NaN	Zero	Min	Max	Average
Date	200	0	0	152	112	0	0	1/5/2025	12/29/2025	7/16/2025

The 'Value distribution' panel shows a bar chart for each column. The 'Query Settings' panel on the right shows the 'Properties' and 'Applied Steps' sections. The 'Properties' section shows the 'Name' as 'Sales_Data'. The 'Applied Steps' section shows the 'Source' and 'Promoted Headers' steps.

Step 6: Record profiling observations.

For each column in each dataset, note the following:

- Data type and total row count
- Null / empty percentage (from Column Quality)
- Distinct value count and unique value count (from Column Distribution)
- Minimum, maximum, mean, and standard deviation for numeric columns (from Column Profile)
- Any errors, mismatched data types, or unexpected values observed

Part C: Identify and Document Data Quality Issues

Step 7: Based on the profiling results, identify data quality issues.

Look for the following common issues:

- High null percentage in important columns such as customer ID or date fields
- Columns with only one unique value — zero variance and no analytical value
- Numeric columns containing text values indicating a data type mismatch
- Date columns with future dates or dates outside the expected range
- Duplicate rows identified through a low uniqueness ratio

Document at least three data quality issues found and note the suggested remediation action for each.

Result

Data from multiple heterogeneous sources (CSV, Excel, and SQL database) was successfully acquired and imported into Microsoft Power BI Desktop. Data profiling was performed using the Power Query Editor's built-in tools — Column Quality, Column Distribution, and Column Profile. Key data quality dimensions including completeness, uniqueness, and validity were assessed across all datasets, and data quality issues were identified and documented for remediation prior to analysis.

Learning Outcomes

After completing this experiment, students will be able to:

- Explain Understood the fundamental concepts of Business Intelligence and data acquisition.
- Gained practical knowledge of acquiring data from CSV, Excel, and SQL Server sources.
- Learned how to import and integrate heterogeneous datasets into Microsoft Power BI.
- Gained hands-on experience with Microsoft Power BI Desktop and Power Query Editor.
- Learned how to use Column Quality to evaluate valid, empty, and error values in datasets.
- Learned how to use Column Distribution to examine distinct and unique values and their frequency.
- Learned how to use Column Profile to examine detailed statistics and characteristics of individual columns.
- Developed the ability to identify missing values, duplicate records, incorrect data types, and inconsistent or unexpected values.
- Understood the importance of data profiling for evaluating data quality before analysis and visualization.
- Gained practical experience in documenting data quality issues and suggesting appropriate remediation actions.
- Developed a better understanding of how clean and reliable data supports accurate business analysis and decision-making.
